AI-POWERED CODE REVIEWER & QUALITY ASSISTANT

PRESENTED BY: JYOTSNAMATHI J

⚠ CHALLENGE

The Code Review Challenge

Time-Intensive

Manual reviews slow down development cycles and delay deployment timelines

Inconsistent Quality

Review standards vary across team members and expertise levels

Expertise Dependency

Quality depends heavily on reviewer knowledge and availability

Technical Debt

Issues accumulate when reviews miss patterns and architectural concerns

Modern development demands automated, intelligent review systems that scale with team growth.

SOLUTION

Hybrid AI-Assisted Code Review

A sophisticated code review tool that combines deterministic analysis with intelligent reasoning to deliver comprehensive, actionable feedback.

Available through both CLI and interactive Streamlit web interface for flexible integration into existing workflows.

01

AST-Based Parsing

Structural analysis of Python code

02

Rule Engine Validation

Deterministic quality checks

03

LLM Reasoning

Context-aware suggestions

04

Structured Reports

Severity-based actionable output

ARCHITECTURE

System Architecture

The system implements a clean, modular architecture where each layer has a distinct responsibility. Code flows through parsing, rule-based validation, AI-enhanced analysis, and finally generates structured reports for developers.

01

Code Input (CLI / UI)

Flexible submission via command line or web interface.

02

AST Parsing Engine

In-depth structural analysis of the codebase.

03

Rule Engine

Deterministic checks for adherence to coding standards.

04

AI Review Engine

Context-aware suggestions and deeper insights.

05

Reporting & Output

Structured, actionable feedback for developers.

Technical Stack

Layer	Technology	Purpose
Parsing	Python AST	Structural code extraction
Rules	Custom modules	Code smell detection
AI Engine	OpenAI API	Context-aware suggestions
Interface	CLI +Streamlit	User interaction
Config	dotenv	Secure key handling

Technology Choices

Built on proven Python ecosystem tools with enterprise-grade security practices. The modular design allows easy extension and customization for team-specific requirements.

API keys and sensitive configuration are managed through environment variables following security best practices.

STATIC ANALYSIS

Static Analysis Engine

AST Extraction

Functions, classes, imports, and parameters parsed directly from code structure

Quality Checks

Missing docstrings, type hints, and structural complexity violations

Code Metrics

Function length, parameter counts, and maintainability indicators

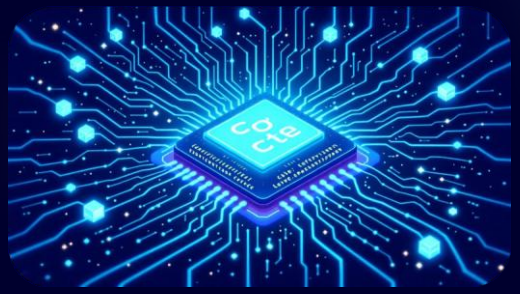
Deterministic, rule-driven validation ensures consistent baseline quality across all code submissions.

AI ENHANCEMENT

AI Review Engine

LLM-Powered Contextual Analysis

The AI engine goes beyond pattern matching to understand code intent and provide human-like reasoning.



Refactoring Recommendations

Suggests architectural improvements based on code patterns and best practices

Readability Enhancements

Identifies complex logic that could benefit from clearer structure or naming

Logical Optimization

Detects inefficiencies and proposes performance improvements

Natural Language Explanations

Provides context-rich feedback that educates developers on the reasoning behind suggestions

Bridges the gap between mechanical linting and thoughtful human code review.

Reporting & Developer Workflow

Severity-Based Categorization

Issues are automatically classified by impact to help developers prioritize fixes effectively.

CLI Integration

```
python -m ai_code_reviewer.cli.main review file.py
```

Optional AI-enhanced mode activated with the `--ai` flag for deeper analysis when needed.

Interactive Dashboard

Streamlit-powered web interface provides visual inspection of findings with filtering, search, and drill-down capabilities.

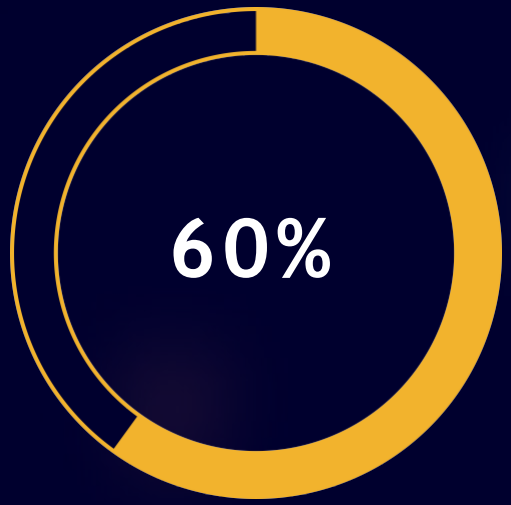
IMPACT

Key Features & Developer Impact

Core Features

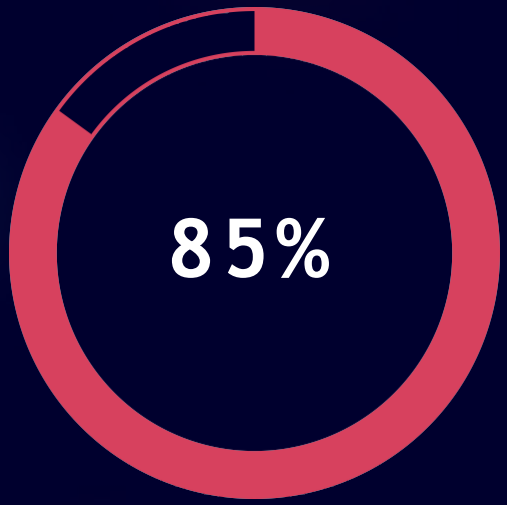
- **Modular Architecture**
  Extensible design for custom rules and integrations
- **Hybrid Analysis Model**
  Combines deterministic rules with AI reasoning
- **Severity Classification**
  Structured, actionable output with priority levels
- **Dual Interface**
  Developer-friendly CLI and interactive web dashboard

Measurable Impact



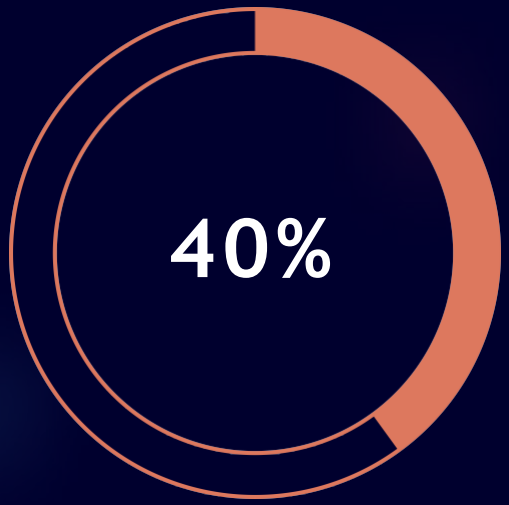
Reduced Review Time

Automated checks eliminate manual inspection of common issues



Consistency Gain

Standardized quality enforcement across all code submissions



Fewer Defects

Improved maintainability through proactive issue detection

THANK YOU
